August, 2021

### 30-9 Fireclay

The name fireclay is given to a group of refractory clays which can withstand temperatures above Pyrometric Cone Equivalent (PCE) value of 19. Refractoriness and plasticity are the two main properties needed in fireclay for its suitability in the manufacture of refractory bricks. A good fireclay should have a high fusion point (>1580°C) and good plasticity. Fireclay containing high alumina and low iron oxide, lime, magnesia & alkalies is preferred by refractory manufacturers. The aluminous (kaolinitic) variety of fireclay is more refractory because of its hardness and density and absence of iron, giving it a white-burning colour. The absence of alkalies gives it a very high fusion temperature.

#### RESERVES/RESOURCES

India possesses substantial reserves of fireclay. The best deposits occur in association with the coal seams in the Lower Gondwana Coalfields of Andhra Pradesh, Jharkhand, West Bengal, Madhya Pradesh and Neyveli lignite fields in Tamil Nadu. Notable occurrences of fireclay, not associated with coal measures, are reported in Gujarat, Jabalpur region of Madhya Pradesh and Belpahar-Sundargarh areas of Odisha. The reserves of fireclay are substantial but reserves of high-grade (non-plastic) fireclay containing more than 37% alumina are limited.

Reserves/Resources of fireclay as per NMI data, based on UNFC system as on 1.4.2015, have been estimated at 722.83 million tonnes. Out of these, 27 million tonnes are grouped under Reserves category while the bulk, i.e., 695.79 million tonnes are classified under Resources category. Out of 27 million tonnes Reserves, 13.29 million tonnes are Proved Reserves and 13.74 million tonnes are Probable Reserves. Out of the total Reserves/Resources, Odisha accounts for 24% followed by Madhya Pradesh (18%), Tamil Nadu (16%), Jharkhand (9%) and Gujarat & Rajasthan (8% each). Gradewise, Refractory-plastic grade accounts for 37% followed by Refractory-nonplastic/semi-plastic (16%) and Refractoryunspecified (14%). The remaining 33% are of Others, Unclassified and Not-known grades (Table-1).

#### **EXPLORATION & DEVELOPMENT**

The exploration & development details if any are covered in the Review on Exploration & Development under "General Reviews".

#### **PRODUCTION**

As per Govt. of India Notification S.O. 423(E), dated 10<sup>th</sup> February 2015, 'fireclay' has been declared as 'Minor Mineral', hence the producers report the production data directly to the respective States and not to IBM. However, efforts were made to collect this information through correspondence with the State Directorates of Mining and Geology of individual States or visiting their websites. But data of only a few states could be collected. All possible information/data that could be gathered has been presented in this Review.

Statewise production of fireclay is furnished in Table-2.

Table-2: Statewise Production of Fireclay

(In tonnes)

| State          |         | Year    |         |
|----------------|---------|---------|---------|
|                | 2016-17 | 2017-18 | 2018-19 |
| Gujarat        | 570087  | 671554  | 638145  |
| Andhra Pradesh | 37410   | 38279   | -       |
| Maharashtra    | -       | 13600   | -       |

#### **USES AND SPECIFICATIONS**

Fireclays are used in the manufacture of cement, bricks, blocks, retorts, crucibles, mortars, masses, pottery, floor tiles, etc. Low-grade material is used for manufacturing heavy sanitaryware, such as, pipes and bath tubs. Firebricks manufactured are used where heat generation is involved, such as in furnaces, kilns and ovens. Firebricks are extensively used in metallurgical industries.

Fireclays are usually graded into: i) Low duty ii) Intermediate duty iii) High duty and iv) Super duty, depending upon their capacity to withstand temperature before melting. The Low duty fireclay can withstand temperatures between 1,515 and 1,615°C (PCE 19-28); Intermediate duty fireclay up to 1,650°C (PCE 30), High duty fireclay up to 1,700°C (PCE 32); and Super duty beyond 1,775°C (PCE 35).

Crude fireclay and other clays including kaolin (china clay) are also used in a few cement manufacturing plants to increase the alumina content in the raw meal and its plasticity. Cement Industry

Figures rounded off

has been the major consumer of crude fireclay followed by Refractory, Ceramic and Iron & Steel industries and Other industries, such as, pesticide, alloy steel, graphite products, foundry, sugar, etc.

#### **FUTURE OUTLOOK**

Fireclay is one of the most important minerals used in the Refractory Industry. India has huge reserves of fireclay and there does not seem to be any problem in respect of supplies to the Refractory Industry in the near future. However, a serious dearth

is being felt in the availability of high-grade fireclay analysing 37% & above  $\mathrm{Al_2O_3}$  with  $\mathrm{Fe_2O_3}$  and fluxing impurities less than 2% for supply to the refractories. To fulfil the increasing demand of the Refractory Industry, it is imperative that deposits of high-grade fireclay be explored and delineated.

The export prospect of fireclay is relatively less as it is considered as low-value high bulk mineral. However, fireclay bricks as a commodity could have high export potential and therefore must be encouraged.
