13(1)	The mining operations in the lease area are not carried out as per approved modified scheme of mining and following deviations are observed during inspection. a) It was proposed in Para 3.5 & plate-5 to drill 10 boreholes during 2013-14 to re-assess the reserves & convert resources into reserves. It is observed during inspection of mine that proposal of 10 boreholes during 2013-14 are not yet drilled. b) It was reported in Para 8.2 that 60% of the ore is high grade containing +58% Fe and remaining in the range of +52% to -58% Fe based on exploration data available and grade of ROM production achieved in previous years. It is observed during inspection of mine that silt accumulated from collapsed overburden benches at the pit bottom during monsoon is not handled & removed, where production proposals are there and allowed to get mixed with ROM material during excavation of ROM production. The grade of mineral production reported in 2013-14 is far below than previous year grade-wise production. It is against mineral conservation and systematic mining.
