30-17 Ochre

Ochre is a natural mineral pigment known to mankind from ages. In ancient times it had been used in colouring earthen-ware, house hold utensils and for decorative purposes. Though its use dates back to prehistoric times, ochre's use only became widespread in the late 19th century, when Jean-Etienne Astier of Roussillon introduced the industrial process for making ochre pigment.

It occurs in various shades and colours generally ranging from yellow to deep orange or brown. The pigmentary strength of ochre is mainly due to the presence of oxides of iron. The presence of hydrated iron oxide imparts yellow colour and anhydrous iron oxide red. A mixture of ferrous and ferric oxide imparts mainly brown besides other shades.

Depending upon the colour, the ochres are called red ochre, yellow ochre, green earth, sienna, umber and various other names. In addition to red ochre, the red oxide of iron, commonly called 'red oxide' is an important natural pigment which results from alteration of haematite & ferruginous laterite.

Red ochre is mostly used in cement industry. The cement grade mix raw material requires a minimum quantum of iron and alumina. The red ochre mixed with limestone makes a perfect mix of constituents in the raw material fed to the cement manufacturing units.

Ochres are non-toxic and are used in manufacturing of paints that not only dries quickly but also covers surfaces thoroughly. Occurrences of ochre have been reported from several states in the country.

RESERVES/RESOURCES

Deposits of red ochre are found chiefly in Bharatpur, Bhilwara, Bikaner, Chittorgarh & Udaipur districts in Rajasthan; Gwalior, Katni and Rewa districts in Madhya Pradesh; Anantapur, Kadapa, Visakhapatnam districts in Andhra Pradesh; Bhavnagar, Kachchh & Patan districts in Gujarat; Ballari & Bidar districts in Karnataka and Chandrapur district in Maharashtra.

Deposits of yellow ochre are found in Guntur and Kurnool districts in Andhra Pradesh, Jabalpur, Mandla, Satna & Shahdol districts in Madhya Pradesh and Nagpur district in Maharashtra.

The total reserves/resources of ochre as on 1.4.2015 as per the NMI data, based on UNFC system, have been estimated at 167.79 million tonnes. Out of these resources, about 36.93 million tonnes are under 'Reserves' category and 130.86 million tonnes are under 'Remaining Resources' category. Of the total, about 87% resources are of red ochre, 11% are of yellow ochre and the remaining 2% are of grades "Not-known". About 78% resources are concentrated in Rajasthan, followed by Madhya Pradesh 11%, Andhra Pradesh 7% and Gujarat about 2%. The remaining 2% resources are located in Karnataka, Maharashtra, Jharkhand and Uttar Pradesh (Table-1).

PRODUCTION & STOCKS

As per Govt. of India Notification S.O. 423(E), dated 10th February 2015, 'ochre' has been declared as 'Minor Mineral', hence the producers report the production data directly to the respective States and not to IBM. However, efforts were made to collect this information through correspondence with the State Directorates of Mining and Geology of individual states or visiting their websites. All possible information/data that could be gathered has been presented in this Review.

State-wise production of ochre is given in Table-2. (Andhra Pradesh -yellow ochre, Gujarat - red ochre)

Table-2: State-wise Production of Ochre

(In tonnes)

State	Year		
	2015-16	2016-17	2017-18
Rajasthan	2362093	1706412	3495864
Andhra Pradesh	255569	138683	145558
Gujarat	45000	2900	304
Madhya Pradesh	21901	-	-

OCHRE

FUTURE OUTLOOK

Ochre is being used as natural pigment since ancient times and it is still being used for this purpose. India has huge resources of both yellow

and red ochre. It is mostly produced in Andhra Pradesh, Rajasthan, Gujarat, Madhya Pradesh and Maharashtra. It is extensively used in paint and colour industry and indian resources are large enough to last for many years in future.
